

### Abstract of the Disclosure

A method for remotely controlling a mobile communication terminal is disclosed. The method includes the steps of: a) determining whether an address of a remote mobile communication terminal is included in a list of short-range mobile communication address; b) if the address of the remote mobile communication terminal is included in the list, controlling the remote mobile communication terminal according to a remote control signal by establishing a communication link with the remote mobile communication terminal from a short distance using a Bluetooth protocol, authorizing a remote control; and c) if not, controlling the remote mobile communication terminal by establishing a call connection with the remote mobile communication terminal and authorizing a remote control.
